                                                                                                                                                                                                                                                                                                   of EBV - for treating Epstein-Barr virus infection, infectious mononucleosis, Hodgkar's disease, Burkitt's Infection, infectious Disclosure; Page 11-12; 20pp; English.

The oligonucleotides given in 039617-18 are selectively hybridisable to the BHREI gene (039619). The antisense oligonucleotides can be used to treat EBV infection in patients suffering from infectious mononucleosis, Hodgkin's disease, Burkitt's lymphoma, undifferentiated nasopharyngeal carcinoma, AIDS related lymphoma or angioinmunoblastic lymphadenopathy. They can also be used to treat EBV-induced proliferating diseases by treating bone marrow from a patient to destroy proliferating tumour cells, then reimplanting the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  119 QSTPXYVVDLSVRGMLEASEGLDGW-IHQQ-------GG-----WGTLIEDNIPGS 161

                            Claim 2: Page 56-61; 71pp; English.

Human HER-2/neu protein (W01111), also called p185 or c-erbB2, is the product of the HER-2/neo oncogene (see also I40739). The protein is over-expressed in various cancers, including breast, ovarian, colon, lung and prostate. The intracellular domain of the protein can be used to immunise an animal against a malignancy with which the oncogene is associated. The polypeptide can be produced in transformed host calls for use in immunisation. Alternatively, animal cells are transfected in vivo or ex vivo with a viral vector that directs expression of the polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        З

PSDB: T39209.

N. PSDB: T39209.

Live recombinant avian vaccine - comprises herpes virus as vector and having sequence encoding antigenic polypeptide inserted between UL55 gene and repeat region

Example 4: Fig 1; 50pp; French.

This is the amino acid sequence of the protein encoded by the open reading frame 5 (ORF-5) from the Bamil I fragment from the herpes virus of turkeys (HVT). The DNA fragment was isolated from HVT strain FC126 (J. Gen. Virol.). 70:1799-1804 (1989)) and is used as a basis for generating live recombinant viral vaccines using the herpes virus DNA sequences as vectors. The fragment contains 3 intergenic regions into which genes encoding heterologous proteins to be expressed can be linserted, preferably under control of the cytomegalovirus immediate early (CWV-IE) promoter. The heterologous proteins can be used to vaccinate
response to HER-2/neu protein. The polypeptide can stimulate T cells and B cells to produce an immune response to the HER-2/neu protein. The method can be used for immunisation against a malignancy in which the HER-2/neu oncogene is associated and in the treatment of an existing tumour, or to prevent tumour occurrence or reoccurrence. Sequence 1255 AA;
                                                                                                                                                                                                                                                                                           | ::| |:| ::| || 387 SNTAPLQPEQLQVFETLEEITGYLYISAWÞDSLPDLSVFQNLQVIRGRILHNGAYSLTLQ 446

Fermentative production of glycerol using recombinant host -

Fortaining genes for glycerol.3-phosphate dehydrogenase and-or

FJ glycerol.3- phosphatase

FJ glycerol.3-phosphatase

Claim 9; Page 31-32; S7pp; English.

CC This Saccharomyces polypeptide comprises a cytosolic

GL glycerol.3-phosphate dehydrogenase (G3DBH) that catalyses the

CC conversion of dlydroxyacetone phosphate to glycerol.3-phosphate.

CC Glycerol.3-phosphatese (G3DBH) that catalyses the

CC Groversion of dlydroxyacetone phosphate to glycerol.3-phosphate.

CC Groversion of dlydroxyacetone phosphatese (G3PBH) see also

CC Groversion of dlydroxyacetone phosphatese (G3PBH) see also

CC Groversion of glycerol.3-phosphatase (G3PBH) see also

CC The glycerol obtained is used in cosmetics, liquid soaps,

CC The glycerol obtained is used in cosmetics, liquid soaps,

CC The glycerol obtained is used in cosmetics, liquid soaps,

CC The glycerol obtained is used and antifreezes; its esters are used in commenced to the oil and fat industries. The method produces glycerol rapidly some.
                                                                                                                                                                                                                                                                                                                                                                                 89 ELVILRK--CMHVCLCCANIDIMTSMMIHGYESWALHCHCSSPGSLQCIAGGQVLASWFR 146

E C Containing genes for glycerol-3-phosphate dehydrogenase and glycerol-3-phosphates glycerol-3-phosphate dehydrogenase (G3PDH) that catalyses containing genes for glycerol-3-phosphates (G3PDH) that catalyses conversion of dlydroyenase (G3PDH) transformed with a conversion of monor, oligo, polysecolificm a variety of the oliming either a G3PDH gene and/or a G3P gene and then of the presence of a monor, oligo, polysecolificm and fat industries. The method produces glycerolifically without generation of polluting by-produces and inaxpensively without generation of polluting by-produces and inaxpensively and the presence of and enaxpensively and the presence of and enaxpensively and and enachped by-produces and enaxpensively and and enachped by-produces and enaxpense glycerolificm and enachped by-produces recombined by-produces and enaxpense glycerolificm and 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

New method for increasing production of 1,3-propane:diol - comprises

Termentation of inexpensive carbon sources by microorganism
expressing dehydratase, used, e.g. to prolong half-life of enzyme
bisclosure; Page 65-66; 133pp; English.

The sequence is that of cytosolic glycerol-3-phosphate dehydrogenase;
The sequence is that of cytosolic glycerol is maproved by
this sexting a method of fermentative production
the transformant in presence of a carbon source (e.g. mono-, oligo-
to poly-saccharide or I substrate) convertible to 1,3-pd;
The transformant in presence of a carbon source (e.g. mono-, oligo-
typelic compounds: 1,3-pd can now be produced by a single
recombinant organism from inexpensive carbon sources such
a glucose (rather than costly glycerol or dihydroxyacetone),
caping and without causing pollution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             HPLLPE-CNTLIMHNVSYVRGLPCSVGFTLIQEWVVPWDMVLTREELVILRKCMHVCLCC 103

The least 9 amino acid(s) prepd. using expression vector of DNA to least 9 amino acid(s) prepd. using expression vector of DNA isolated from human epidermal growth factor receptor

Disclosure; Fig 13: 49pp; English.

This claimed sequence is free of transmembrane or intracellular portions of the HERZ mol. The protein is antigenic in animals.

Fragment comprising at least 9 amino acids open several possibilities for further research and a broad range

C foptential therapeutic apllications, e.g. for the treatment of mammanary gland adenocarcinoma and other cancers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | ::| ||| | ::| ||| 366 SNTAPLQPEQLQVFETLEEITGYLYISAWRDSLPDLSVFQNLQVIRGRILHNGAYSLTLQ 425

New DNA sequences coding for oxido:reductase(s) and other enzyme(s) - useful for expression in microorganisms to give high yields for bleaches and detergents.

Disclosure: Fig 11A-11B: 99pp; English.

The gene encoding this protein (EC-1.1.3.13) is used (in combination with its regulatory sequences and/or those of dihydroxyacetone-synthetase) to produce genetically engineered microorganisms that produce oxidases or other enzymes in yields that allow industrial application on a large scale. The engineered yeasts can produce oxidases having improved properties with respect to their application in oxidation reactions and/or in bleaching and (UNIL) UNILEVER NV. 352 LITNGIEAGVKIRPTEEELATADEDFRRGYAEYFENKPDKPLMHYSVISGFFGDHTKIPN 411 467 126 : : : : | | : : 1 | . : 468 ARRMESFAGEVISHPLFKVDSPARARDLDLETCSAYAGPKHLTANLYHG--SWTVPIDK 525 89 The DNA encoding this sequence is identical with that of HER4 (Q64896) up to nucleotide 3168, where the sequence diverges and the ONF stops after 13 amino acids, followed by an extended, unique 3'-UTR.
HER4 is the fourth member of the EGFR-family of tyrosine kinases and is expressed in some human cancers and in some tissues of neuronal or muscle origin. HER4 polynucleotides, opt. labelled, are useful in assays (e.g. of HER4 mRNA to detect certain neoplasms, esp. Sequence 1058 AA; HER4 with alternate 3'-end without AP domain. Lyttgoe J.N., Hall L.;

*Rod opsin cDNA sequence from the sand goby (Pomatoschistus minutus) compared with those of other vertebrates.*;

Proc. R. Soc. Lond., B. Hall. Sci. 248:19-25(1992).

1- FUNCTION: VISUAL PIGHENTS ARE THE LIGHT-ABSORBING MOLECULES THAT MEDIATE VISION. THEY CONSIST OF AN APOPROTEIN, COVALENTLY LINKED TO CIS-RETINAL.

1- SUBCELLULAR LOCATION: INTEGRAL MEMBRANE PROTEIN.

1- TISSUE SPECIFICITY: ROD SHAPED PHOTORECEPTOR CELLS WHICH MEDIATES
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          EMBL; X62405; CAA44275.1; -.
